

# CREEPER ANATOMY

Creepers are one of the most dangerous mobs in Minecraft. They will run toward you then explode, possibly killing you and destroying everything in the surrounding area. Creepers are almost completely silent, which makes it easy for them to take you by surprise. They hiss quietly just before they explode.

Creepers have internal and external parts, which help them survive and meet their needs. Creepers receive different types of information through their senses, process the information in their brain, and respond to the information.

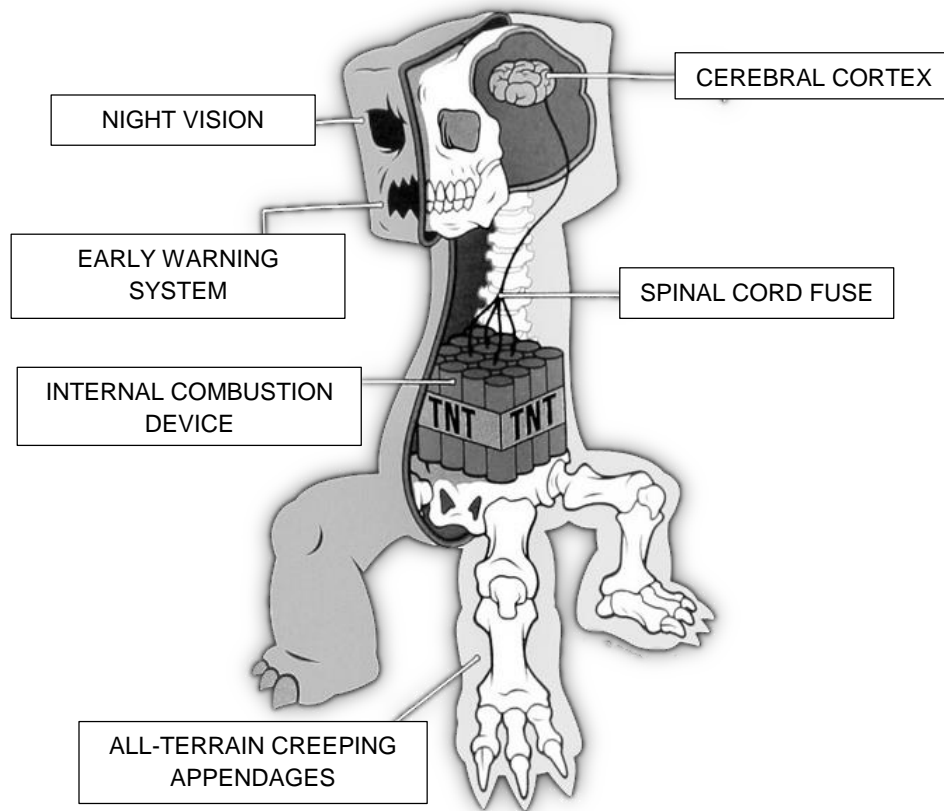

## ANATOMY OF A CREEPER

# CREEPER ANATOMY

## Activity

*Explain how each internal and external part helps the Creeper survive and meet their needs.*

1. CEREBRAL CORTEX –
