

## CAPTURE YOUR SHADOW

### SCIENCE SAFETY

PLEASE follow these safety precautions when doing any science experiment.

- **ALWAYS** have an adult present.
- **ALWAYS** wear the correct safety gear while doing any experiment.
- **NEVER** eat or drink anything while doing any experiment.
- **REMEMBER** experiments may require marbles, small balls, balloons, and other small parts. Those objects could become a **CHOKING HAZARD**. Adults are to perform those experiments using these objects. Any child can choke or suffocate on uninflated or broken balloons. Keep uninflated or broken balloons away from children.

### INGREDIENTS

- Blank Canvas
- Glow-In-The-Dark Paint
- Bright Flashlight
- Wax Paper
- Construction Paper
- Plastic Wrap

### INSTRUCTIONS

**STEP 1:** Paint the blank canvas with the glow-in-the-dark paint. Allow the canvas to dry.

**STEP 2:** Using the bright flashlight attempt to shine a beam of light through a piece of wax paper, construction paper, and plastic wrap. What happened? Which object is considered translucent, transparent, and opaque? Why? Make observations to construct an evidence-based account that objects in darkness can be seen.

**STEP 3:** Place your hand on the canvas, have someone turn off the lights, shine the bright flashlight over your hand, turn off the bright flashlight, remove your hand, and observe. What happened? Why? Make observations to provide evidence that energy can be transferred from place to place by light.

### EXPLANATION

The glow-in-the-dark paint absorbs light and then re-emits the light over a period of time, causing the canvas to glow. Your hand stops the light from reaching the paint, therefore preventing that area from glowing, making it look as if your shadow was captured.

### SCIENCE BACKGROUND

Light is energy you can see, which travels in a straight line until it hits an object. Shadows are evidence of light traveling in straight lines. Once light hits an object it can reflect, refract, or absorb. Reflect means to bounce off, refract means to bend, and absorb means to take in. Light transfers energy from one location to another. Objects can be seen if light is available to illuminate them or if they give off their own light. Transparent materials allow most light to pass through. Translucent materials allow some light to pass through. Opaque materials block all light from passing through. Mirrors can be used to redirect a beam of light.

### I CAN STATEMENTS

- ✓ I can make observations to construct an evidence-based account that objects in darkness can be seen only when illuminated.
- ✓ I can plan and conduct investigations to determine the effect of placing objects made with different materials in the path of a beam of light.
- ✓ I can make observations to provide evidence that energy can be transferred from place to place by light.
